

# Sourcefire Solutions for The Real World

Introducing Enterprise Threat Management (ETM)-Sourcefire's intelligent security infrastructure for efficient and effective risk management. ETM is the integration of a variety of network security technologies under one management console to provide all-the-time/real-time knowledge of attacks, targets, and the state of your critical systems. With Sourcefire ETM, your organization will have the maximum knowledge to protect against attacks.

## Intrusion Prevention

Intrusion Prevention-Sourcefire is widely regarded as having the most comprehensive intrusion prevention system (IPS) available today, powered by the de factor standard Snort® rules-based detection engine. To take Sourcefire IPS™ to the next level, leverage the real-time network intelligence of Sourcefire RNA™ (Real-time Network Awareness) to enable Adaptive IPS, which saves time and money by significantly reducing the number of actionable events and automating the ongoing IPS tuning process.

	Sourcefire 3D™ System	Traditional IPS
Amount of Human Intervention Required	HIGHLY AUTOMATED	PEOPLE INTENSIVE
Cost to Operate	LOWER	HIGHER
Number of False Positives	LOWER	HIGHER
Number of False Negatives	LOWER	HIGHER
Potential for Network Downtime	LOWER	HIGHER

## Network Visibility

Sourcefire RNA provides a real-time inventory of all operation systems (OSes), services, applications, protocols, and potential vulnerabilities that exist on the network. Once RNA has established a network inventory baseline, its powerful Policy and Response engine can notify Information Security or Network Operations when a new host appears on the network and/or when an existing host has changed its approved configuration.

## Network Behavior Analysis (NBA)

Sourcefire's NBA solution solves the daily challenges faced by Information Security and Network Operations. Sourcefire RNA enables Information Security to detect and quarantine internal threats by establishing traffic baselines and detecting network anomalies. RNA enables Network Operations to monitor bandwidth consumption across the network and troubleshoot network outages and performance degradations.

## Virtualization

The Sourcefire 3D® System defends both physical and virtual environments. By placing 3D Sensors at ingress and egress points to your virtualized systems, Sourcefire can detect, alert and block threats that emerge from inside and outside your virtualized systems. To help combat "VM Sprawl" Sourcefire can detect VMware virtual machines and classify them as such within RNA host records. This enables IT security to identify new hosts in real time as either physical or virtual and helps to ensure compliance with configuration management, change management, and acceptable use policies (AUPs)

**HURRY!** Contact us now and tell us that you're interested to do the product evaluation (POC) and get a mysterious gift\*.
